What is VeriFi

A finance social media app where users publish structured market claims and suggested positions that are signed, verifiable, and resolved against real data.

Core proposition.

A user's financial reputation on VeriFi cannot be faked or retroactively edited.

Motivation

Existing platforms give investors lots of opinions, but weak accountability:

- posts can be deleted or reworded after the outcome,
- expertise is self-declared instead of measured,
- screenshots and social proof are easy to manipulate,
- vague predictions cannot be resolved objectively.

VeriFi supplies all three missing properties: **social**, **verifiable**, and **quantifiable**.

Spec	VeriFi	X	Trading View	Stocktwits
Structured market claim	✓	–	–	–
Wallet-signed proof	✓	–	–	–
Objective price resolution	✓	–	–	–
Outcome-based reputation	✓	–	–	–
Claim-market voting	✓	–	–	–
Public finance feed	✓	✓	✓	✓
Charts / price context	✓	–	✓	–

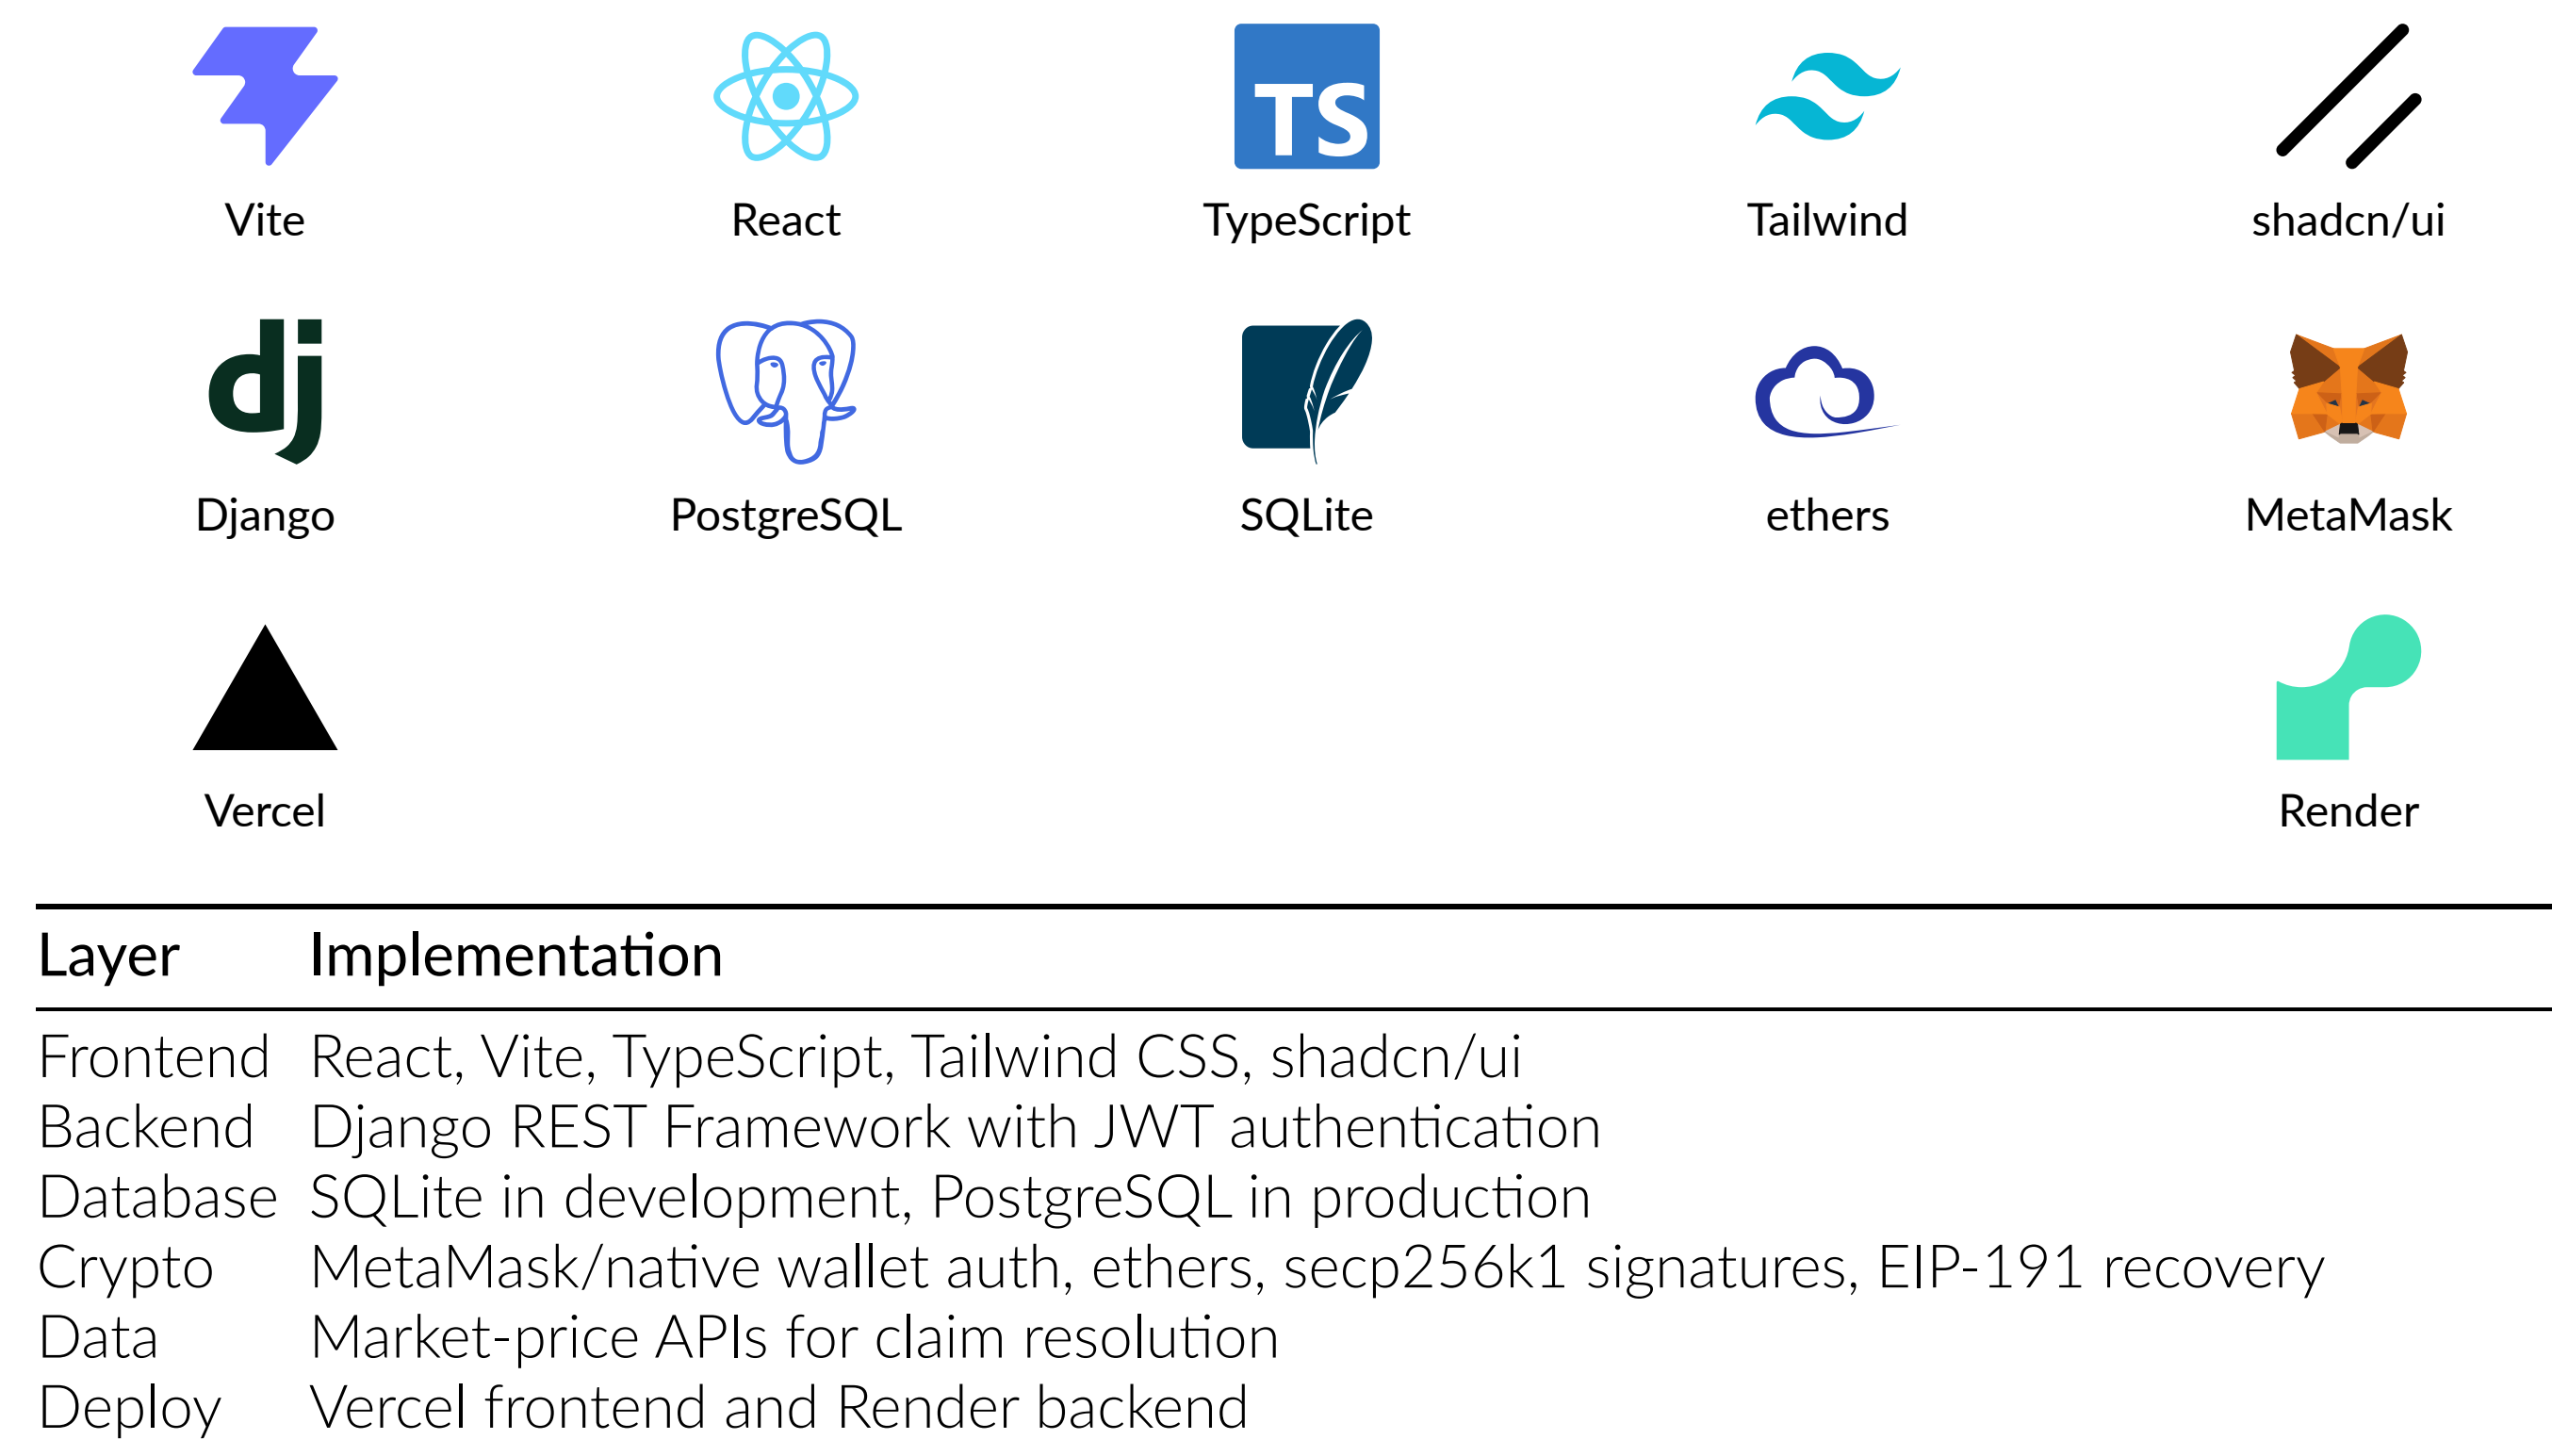

Components

Claims, Positions, Reputation Score, Reputation Market, Channels, Proofs

Hard Claims:

- asset, direction, percentage, deadline
- signed by the user's wallet
- resolved after expiry using market data

Technical Stack

Design

Every content is signed by users.

VeriFi uses wallet-based identity. Users authenticate with a native browser wallet or MetaMask, and the private key stays on the client.

Proofs make claims portable.

- claim payload,
- wallet address,
- signature,
- timestamp.

Future work.

Train a VeriFi-owned finance LLM for the LLM extractor component, so claim parsing becomes more domain-specific and less dependent on generic extraction.

How Reputation Market Work

Reputation Market ensures:

- early foresighters are rewarded more,
- copycat predictions do not dominate,
- trivial claims are not rewarded heavily,
- wrong claims reduce credibility.

What VeriFi brings:

- measurable finance discussion,
- public profiles backed by resolved claims,
- proof files that anyone can verify,
- channels for focused communities,
- a reputation layer based on outcomes.
